ANNUAIRE
PLUVIOMETRIQUE
1978 * 79

I N T R O D U C T I O N

I.- PRESENTATION DE L'ANNUAIRE

La présente publication contient toutes les observations pluviométriques mensuelles et annuelles faites dans 504 stations pluviométriques de la Tunisie durant l'année hydrologique 1978-79 qui s'étend du 1er Sept. 1978 au 31 Août 1979.

La répartition des postes pluviométriques dans le présent annuaire suit la division hydrométrique du pays en 7 grands bassins portant des numéros de codification de 3 à 9:

- le bassin 3 : couvre l'extrême Nord de la Tunisie : les pays forestiers du N-W et la région des lacs d'Ichkeul et de Bizerte.
- le bassin 4 : comprend le bassin versant du Miliane et le Cap-Bon
- le bassin 5 : correspond au bassin de la Medjerda
- le bassin 6 : couvre tout le Centre de la Tunisie (Zéroud, Merguellil, Nebhana).
- le bassin 7 : comprend le Sahel de Sousse et de Sfax.
- le bassin 8 : s'étend de la limite Sud des bassins 6 et 7 (Centre et Sahel) jusqu'au Nord du Chott el Jerid.
- le bassin 9 : couvre l'extrême Sud jusqu'aux frontières Algériennes et Libyennes.

A l'intérieur de chaque bassin, les postes pluviométriques sont classés par ordre alphabétique et portent des numéros de codification mécano-graphique de cinq chiffres dont le premier correspond au numéro du bassin auquel appartient le poste.

Une liste complète des postes pluviométriques figurant dans cette publication est donnée dans les pages qui suivent.

II.- PRESENTATION DES RELEVÉS PLUVIOMÉTRIQUES

1/ La première partie de la présente publication est une analyse sommaire de la pluie en Tunisie durant l'année agricole 1978-79. A cet effet 84 stations ont été choisies (à raison de 4 à 5 par gouvernorat) pour caractériser la situation pluviométrique au cours de cette année. Des graphiques et des cartes d'isohyètes mensuelles, saisonnières et annuelles illustrent cette analyse.

2/ La deuxième partie comprend les relevés pluviométriques journaliers. Ces relevés se présentent sous forme de tableaux annuels par station et sont groupés par bassin et par ordre numérique.

o Au bas de chaque tableau nous donnons :

+ les totaux pluviométriques mensuels et annuels si les observations sont complètes.

+ le nom de l'observateur

+ un commentaire chiffré concernant :

. l'origine des relevés : bulletin original de la DRES, copie d'après bulletin de la Météorologie Nationale...

* La valeur des observations : Relevés quotidiens ou non quotidiens, complets ou incomplets...

. La qualité de ces valeurs : collationnés ou douteux, corrigés ou reconstitués.... En effet, dans le souci de publier le maximum de relevés pluviométriques, nous avons été amenés à compléter les tableaux de certains postes pluviométriques pour lesquels on dispose d'au moins 6 bulletins d'observations mensuelles. Les mois manquants sont alors reconstitués à partir des postes voisins à condition que la valeur estimée ne dépasse pas 15 % du total annuel de la station considérée.

+ Pour chaque mois, le nombre de jours de pluie total, et le nombre de jours de pluie supérieure à 1 mm, à 10 mm et à 30 mm.

. Et à la fin de chaque page, nous donnons les éléments de décodage du commentaire chiffré.

Quant à la critique des données, elle se fait une première fois à la réception du bulletin pluviométrique. Elle consiste à comparer les relevés de postes voisins et éliminer toute observation qui nous semble aberrante. Une deuxième critique se fait à la préparation de l'annuaire par une comparaison des bulletins avec leur double, et avec les souches afin de noter les rectifications éventuelles. Les valeurs qui nous semblent vraies ou acceptables sont reproduites fidèlement telles qu'elles sont sur le bulletin d'observations. Aussi quelques pluviométries journalières sont décalées d'une journée. Les observateurs ont en effet reçu la consigne de faire leurs observations quotidiennes à 8h du matin et de marquer les quantités mesurées à la date de la veille, mais malheureusement cette consigne n'a pas toujours été bien respectée. Toutefois, les décalages chevauchant sur 2 mois ont été corrigés.

En conclusion, nous prions Messieurs les utilisateurs de nous communiquer leurs remarques et leurs suggestions afin d'apporter les améliorations nécessaires à nos futures publications.

Aperçu sur la pluviométrie de l'année 1979-80

La pluviométrie de l'année agricole 1979-80 a été insuffisante pour les gouvernorats du Nord (28% de déficit au Kef, 19% à Béja, 33% à Zaghouan....) ainsi que ceux de Kasserine et de Kairouan (26% à Kasserine, 29% à Oueslatia.).

C'est le Sud-Est qui a été très favorisé cette année : on y a enregistré 465mm à Matmata et à Zarzis, soit un excédent de 100% et 113%.

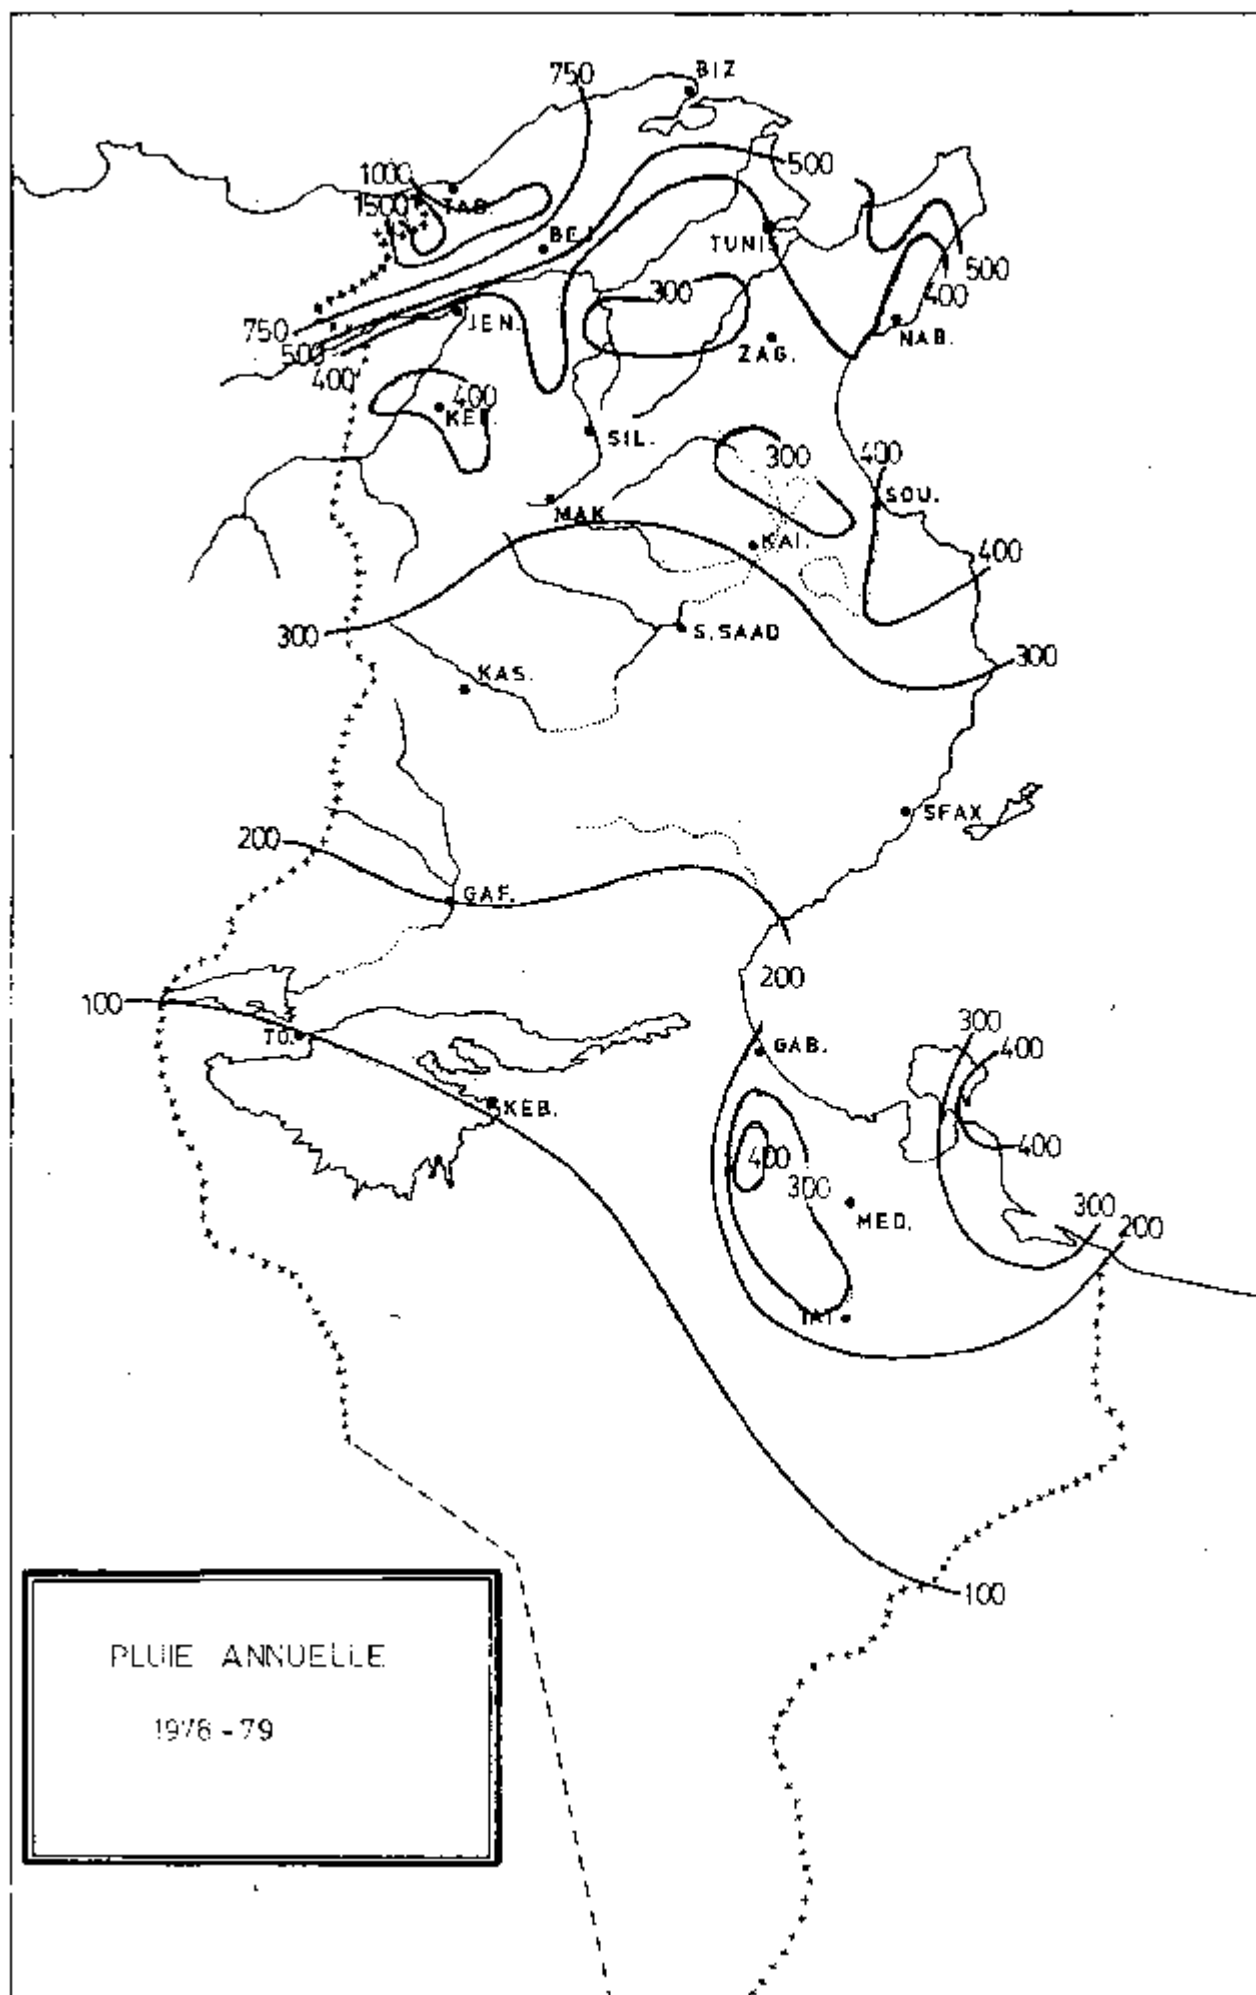

La répartition saisonnière se caractérise par :

- Un automne tardif, mais très humide sur le littoral oriental,
- Un hiver largement déficitaire,
- Un printemps précoce, mais court.

Au point de vue mensuel, les mois de Septembre, Décembre, Janvier, Mai et Juillet ont été déficitaires sur tout le pays.

Le mois de Février a été très pluvieux et partout excédentaire. Des surplus de 200 à 600% ont été enregistrés. On y remarque également un phénomène très exceptionnel : des chutes de neige se sont produites le 17 sur le Sud du pays donnant 2 à 40 cm de hauteur.

Par ailleurs, l'insuffisance des quantités de pluies est due à la faiblesse des hauteurs des pluies quotidiennes et non à un manque dans le nombre de jours pluvieux.
