INTRODUCTION

I. PRESENTATION DE L'ANNUAIRE

La présente publication contient toutes les observations pluviométriques mensuelles et annuelles faites dans 590 stations pluviométriques de la Tunisie durant l'année hydrologique 1985/86 qui s'étend du 1er septembre 1985 au 31 août 1986.

La répartition des postes pluviométriques dans le présent annuaire suit la division hydrométrique du pays en 7 grands bassins portant des numéros de codification de 3 à 9 :

-Le bassin 3 : couvre l'extrême Nord de la Tunisie : les pays forestiers du N-W et la région des lacs d'Ichkeul et de Bizerte.

-Le bassin 4 : comprend le bassin versant du Miliane et le Cap-Bon.

-Le bassin 5 : correspond au bassin de la Medjerda.

-Le bassin 6 : couvre tout le Centre de la Tunisie (Zeroud, Merguellil, Nebhana).

-Le bassin 7 : comprend le Sahel de Sousse et de Sfax.

-Le bassin 8 : s'étend de la limite Sud des bassins 6 et 7 (Centre et Sahel) jusqu'au Nord du Chott El Jerid.

-Le bassin 9 : couvre l'extrême Sud jusqu'aux frontières Algériennes et Lybiennes.

A l'intérieur de chaque bassin, les postes pluviométriques sont classés par ordre alphabétique et portent des numéros de codification mécanographique de cinq chiffres dont le premier correspond au numéro du bassin auquel appartient le poste.

Une liste complète des postes pluviométriques figurant dans cette publication est donnée dans les pages qui suivent.

II. PRESENTATION DES RELEVÉS PLUVIOMETRIQUES

1) La première partie de la présente publication est une analyse sommaire de la pluie en Tunisie durant l'année agricole 1985/86. A cet effet 66 stations ont été choisies (à raison de 2 à 5 par gouvernorat) pour caractériser la situation pluviométrique au cours de cette année. Des graphiques et des cartes d'isohyètes, mensuelles, saisonnières et annuelles illustrent cette analyse.

2) La deuxième partie comprend les relevés pluviométriques journaliers. Ces relevés se présentent sous forme de tableaux annuels par station et sont groupés par bassin et par ordre numérique.

Au bas de chaque tableau nous donnons :

- + Les totaux pluviométriques mensuels et annuels si les observations sont complètes.

- + Le nom de l'observateur

- + Un commentaire chiffré concernant :

L'origine des relevés : bulletin original de la D.R.E copie d'après bulletin de l'Institut National de la Météorologie...
La valeur des observations : Relevés quotidiens ou non quotidiens complets ou incomplets.

La qualité de ces valeurs : collationnées ou douteuses, corrigées reconstituées... En effet, dans le souci de publier le maximum de relevés pluviométriques, nous avons été amenés à compléter les tableaux de certains postes pluviométriques pour lesquels on dispose d'au moins 6 bulletins d'observations mensuelles. Les mois manquants sont alors reconstitués à partir des postes voisins à condition que la valeur estimée ne dépasse pas 15% du total annuel de la station considérée.

- + Pour chaque mois, le nombre de jours de pluie total et le nombre de jours de pluie supérieure à 1 mm, à 10 mm et à 30 mm

Nous donnons les éléments de décodage du commentaire chiffré à la page 39

Quant à la critique des données, elle se fait une première fois à la réception du bulletin pluviométrique. Elle consiste à comparer les relevés de postes voisins et éliminer toute observation qui nous semble aberrante, une deuxième critique se fait à la préparation de l'annuaire par une comparaison des bulletins avec leur double, et avec les souches afin de noter les rectifications éventuelles. Les valeurs qui nous semblent vraies ou acceptables sont reproduites fidèlement telles qu'elles sont sur le bulletin d'observations. Aussi quelques pluviométries journalières sont décalées d'une journée, les observateurs ont en effet reçu la consigne de faire leurs observations quotidiennes à 7h du matin et de marquer les quantités mesurées à la date de la veille, mais malheureusement cette consigne n'a pas toujours été bien respectée. Toutefois, les décalages chevauchant sur 2 mois ont été corrigés.

En conclusion, nous prions Messieurs les utilisateurs de nous communiquer leurs remarques et leurs suggestions afin d'apporter les améliorations nécessaires à nos futures publications.

ANALYSE SOMMAIRE DE LA PLUVIOMETRIE
DE L'ANNEE 1985 - 1986

--: 90\$:--

La pluviométrie de l'année 1985-86 a été caractérisée par un déficit sur l'ensemble de la Tunisie à quelques exceptions près. D'après la carte des isohyètes annuelles et celle des indices annuels, on remarque que :

- Le total annuel maximum comme le total annuel minimum sont tous les deux déficitaires : les 1288mm de pluie de Ain Draham correspondent à 20% de déficit et les 72mm de Tozeur à 25% de déficit.

- La moitié sud du pays se trouve en deça de 200mm de total pluviométrique annuel.

- Au Nord de la Dorsale, plus de 25% des stations pluviométriques n'ont pas atteint 300mm de pluie totale. A l'exception de la région de Sétif - Tabarka qui a enregistré plus de 1000mm de pluie et un excédent moyen de 5%, tout le reste du pays est déficitaire : les déficits varient de 44% à 12% : 23% à Bizerte pour 512mm de pluie, 18% à Béja pour 458mm, 29% à Jendouba pour 332mm, 30% au Kef pour 374mm, 12% à Siliana pour 372mm, 44% à Zaghouan pour 284mm, 32% à Nabeul pour 266mm, 36% à Tunis pour 291mm de pluie annuelle.

- Au Centre, les hautes stepes, le Kairouanais, et le Sahel nord ont dépassé 200mm de pluie totale. Les indices annuels sont très variés. On a enregistré : 254mm de pluie à Kasserine et 20% de déficit, 246mm à Kairouan et 21% de déficit, 224mm à Sousse et 35% de déficit, mais 334mm à Monastir et 7% de déficit seulement.

- Le Sahel de Sfax se rattache au Sud où les valeurs annuelles sont comprises entre 100 et 200mm, à l'exception du Sud Ouest (de Metlaoui à Nefta) et de l'extrême Sud (Tataouine-Renada) qui sont en dessous de 100. On a enregistré : 196mm à Sfax et 21% de déficit, 140mm à Gafsa et 18% de déficit, 128mm à Gabès et 37% de déficit, 111mm à Méchine et 27% de déficit.

.../...

107mm à Matmata et 54% de déficit. Cependant certaines stations ont dépassé leur moyenne interannuelle et sont excédentaires : Zarzis a 264mm de pluie et 9% d'excédent, Kébili a 108mm et 18% d'excédent, Remada à 95mm de pluie et 7% d'excédent.

La répartition saisonnière des pluies se présente comme suit :

- L'année hydrologique a commencé par un automne déficitaire, déficit d'autant plus ressenti qu'il succède à une saison d'été 1965 très sèche. Les régions céréalières du Nord ont enregistré un total saisonnier dérisoire (41mm à Jendouba, 43mm au Kef, 60mm à Béjà, 67mm à Siliana, 55mm à Zaghouan) et des déficits supérieurs à 60%. Le Centre et le Sud sont dans l'ensemble moins affectés par la sécheresse et Kairouan y est même excédentaire de 16% avec 139mm de pluie.-

- La saison d'hiver, bien que plus pluvieuse que la saison précédente (201mm à Bizerte, 746mm à Ain Draham, 241mm à Béjà, 150mm à Jendouba, 134mm au Kef....) demeure elle aussi déficitaire. Seules les stations de Béjà, Ain Draham, Sousse au Nord, Sfax et Chaal au Centre, et le Sud Est sont excédentaires ; les excédents s'élèvent à 3% à Béjà, 32% à Sfax, 19% à Médénine, 164% à Zarzis (pour 241mm de pluie) 116% à Ben querdane et 16% à Remada. Sur le reste du pays, les déficits vont de 16% à Jendouba, à 80% à Zaghouan.

- Le printemps a été relativement une saison pluvieuse, et excédentaire. Les totaux pluviométriques ont été supérieurs à 100mm pour la moitié nord du pays. Des excédents très forts ont été enregistrés à Nabeul (90%) Sousse (116%) Monastir (142%) Sidi Bouzid (87%) Kébili (146%) Tozeur (65%) Gabès (93%) Malheureusement, le Nord Ouest est resté déficitaire, on remarque des déficits de 9% à Béjà, de 24% au Kef, de 29% à Jendouba... Il en est de même au Sud Est où Médénine et Matmata ont 43% de déficit, Zarzis en a 70%, Ben querdane 81%...

- L'Eté : peut également être considéré comme une saison excédentaire. Au Nord et au Centre certaines stations ont totalisé des quantités de pluie aussi importantes ou même supérieures à celles de l'automne ou celles de l'hiver. C'est le cas de Jendouba, Siliana, le Kef, Kasserine, Sidi Bouzid, Gafsa, soit toute la Tunisie continentale. Les excédents sont très forts, mais on trouve encore des stations déficitaires au Nord et au Centre ainsi que tout le Sud.-

. La contribution de chaque saison au total annuel varie selon les stations :

Elle est faible pour l'automne et ne dépasse 20% que pour quelques stations comme Kairouan (57%) la Chebba (46%) El Haouaria (36%) Sejnane (27%)...

- Celle de l'hiver est maximale pour l'extrême - Nord, la haute et Moyenne Mejerda, Sfax et le Sud Est. Elle y varie de 40% à Bizerte à 92% à Zarzis.

- La contribution du printemps est la plus forte sur le reste du pays où elle dépasse pratiquement partout les 50% : 52% à Tunis, Kasserine, Monastir, Gafsa, 62% à Nabeul, 57% à Monastir,...

- La participation de l'été, insignifiante par la majorité des stations, dépasse 10%, 20% et même 30% pour quelques stations : 14% à Jendouba, 21% au Kef, 22% à Siliana, 26% à Gafsa, 31% à Fériana où elle est supérieure à celles de l'automne et de l'hiver cumulées.

A l'échelle mensuelle, les mois d'Octobre et de Novembre sont les plus déficitaires, les mois de Mars et de Juillet sont les plus excédentaires. Le mois de Mars est le plus pluvieux de l'année pour la majorité des stations (92mm à Tunis, 121mm à Zaghuan, 128mm à Nabeul, 161mm à Monastir, 177mm au Kef, 79mm à Siliana, 85mm à Kasserine, 54mm à Remada...) Le mois de Juillet a également été relativement pluvieux et ses excédents sont très forts (55mm au Sers, 57mm à Kélibia, 64mm à Fériana....)

Les mois de Décembre et de Janvier ont enregistré pour quelques stations des pluies importantes, supérieures à celles des autres mois. Au mois de Décembre, Sfax a totalisé 70mm, Zarzis en a eu 217, Ben guerdane 130 et Médenine 59. Au mois de Janvier c'est au Nord Ouest qu'on a enregistré les maxima mensuels : 117mm à Béja, 280mm à Ain Draham, 85mm à Jendouba.

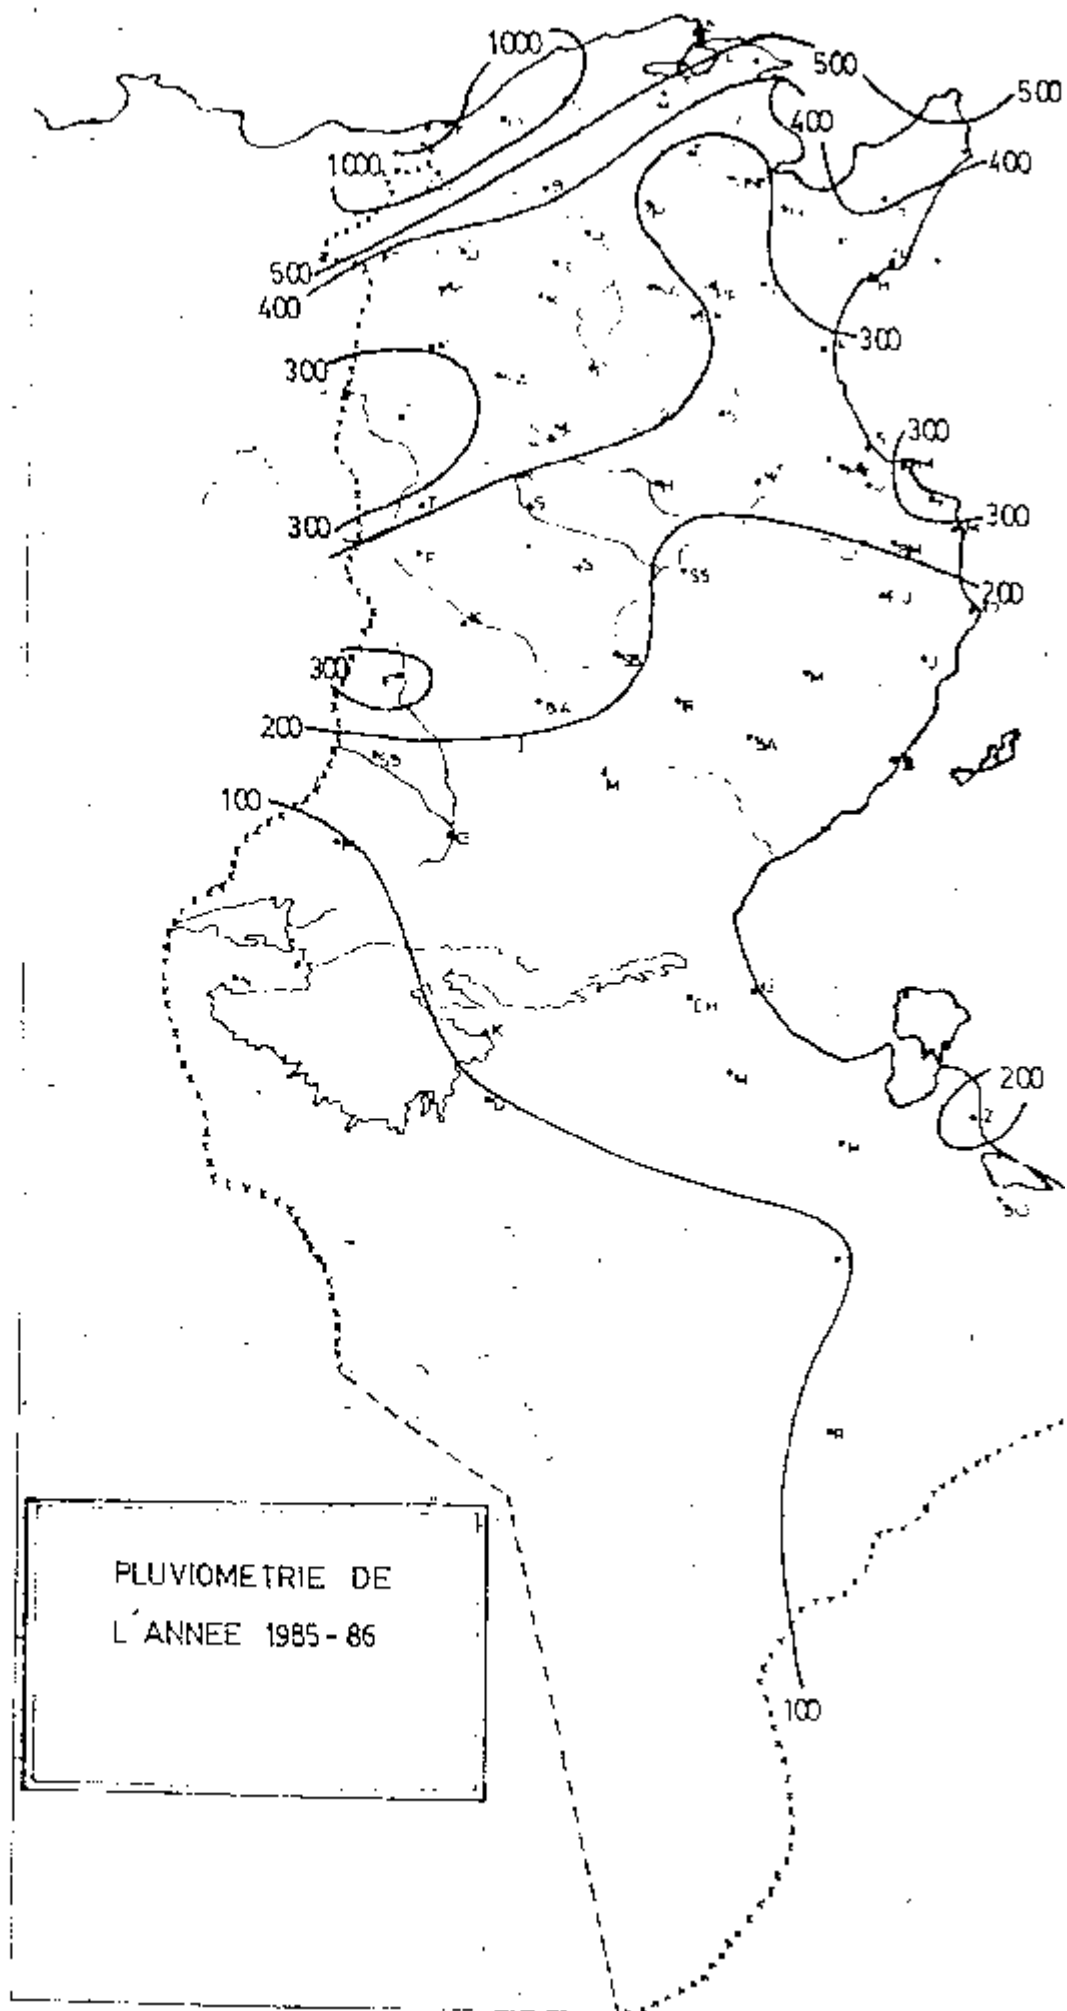

Pour les autres mois de l'année, le nombre de stations excédentaires est faible et leur répartition est très variable d'un mois à l'autre. A la fin de l'année, la plupart des stations comptent 3 à 4 mois excédentaires.

Quant au nombre de jours de pluie, il varie de 107 jours à Bizerte à 12 jours à Matmata. Le maximum mensuel correspond principalement au mois de Mars (17 jours à Kélibia.) et au mois de Janvier, (22 jours à Bizerte)

De cette analyse, on aboutit à la conclusion générale suivante :
La pluviométrie de l'année hydrologique 1985-86 est composée de 2 périodes :

- une période déficitaire s'étalant sur la saison de l'automne et celle de l'hiver, les mois les plus secs étant ceux d'Octobre et de Novembre, précédée déjà par une saison d'été 1985 très sèche.

- Une période excédentaire couvrant les saisons de printemps et d'été, les excédents les plus forts correspondent aux mois de Mars et de Juillet et loin de combler les déficits antérieurs n'ont pu qu'améliorer relativement la situation.-

PLUVIOMETRIQUES

ANNUELLES

MISE EN GARDE :

Le commentaire chiffré (COM de l'avant-dernière ligne du tableau) se compose de 3 colonnes : la 1ère se rapporte à l'origine des relevés la 2ème à leur valeur, la 3ème à leur qualité.

Le décodage de ces chiffres se fait à l'aide du tableau suivant :

| ORIGINE | VALEUR | QUALITE |
|--------------------------|----------------------------------|-------------------------------------|
| 0 : Pas d'avis | 0 : Pas d'avis | 0 : Non collationné |
| 1 : Originaux DRE | 1 : Relevés quotidiens complets | 1 : Pas de doute |
| 2 : Copie météo | 2 : Quelques jours groupés | 2 : Collationné |
| 3 : Copie d'ap.Originaux | 3 : Quotidiens incomplets | 3 : Décalage temps |
| 4 : Copie | 4 : Non quotidiens et incomplets | 4 : Douteux |
| 5 : Edition | 5 : Total mensuel | 5 : Inutilisable |
| 9 : Inconnue | 9 : Pas de mesure | 6 : Décade |
| | | 7 : Corrigé |
| | | 8 : Reconstitution par voisinage |
